# Agenda

- Introduction
- Balanced Scorecard (BSC) framework
- Functional Size Measurement (FSM)
  - Evolution of FSM
  - FSM and Technical Size Measurement (TSM)
- Joining FSM and BSC
- Concluding Remarks

# Introduction

## Performance Measurement Models (PM):

such as the Balanced Scorecard (BSC) are well evaluated by Top Management, also in tailoring versions for software (the so-called "ICT BSCs")

**Missing elements:** the I (indicator) element from the so-called GDI triad (Goal-Driver-Indicator)

# Introduction

**Possible path to follow:** it is currently hard to operationalize Software Intensive Organisations (SIOs) with measures, and a choice of measures has to be done. This has not been achieved well to date, and in such a multi-dimensional model as BSC.

**Objective of the presentation:** to show which measures can be recommended to SIOs wishing to implement an ICT BSC.

# Agenda

- Introduction
- Balanced Scorecard (BSC) framework
- Functional Size Measurement (FSM)
  - Evolution of FSM
  - FSM and Technical Size Measurement (TSM)
- Joining FSM and BSC
- Concluding Remarks

# BSc framework

**BSc** is a multidimensional framework for “*translating (organisational) strategy into action*” at all levels of an enterprise, by linking objectives, initiatives and measures to an organisation’s strategy

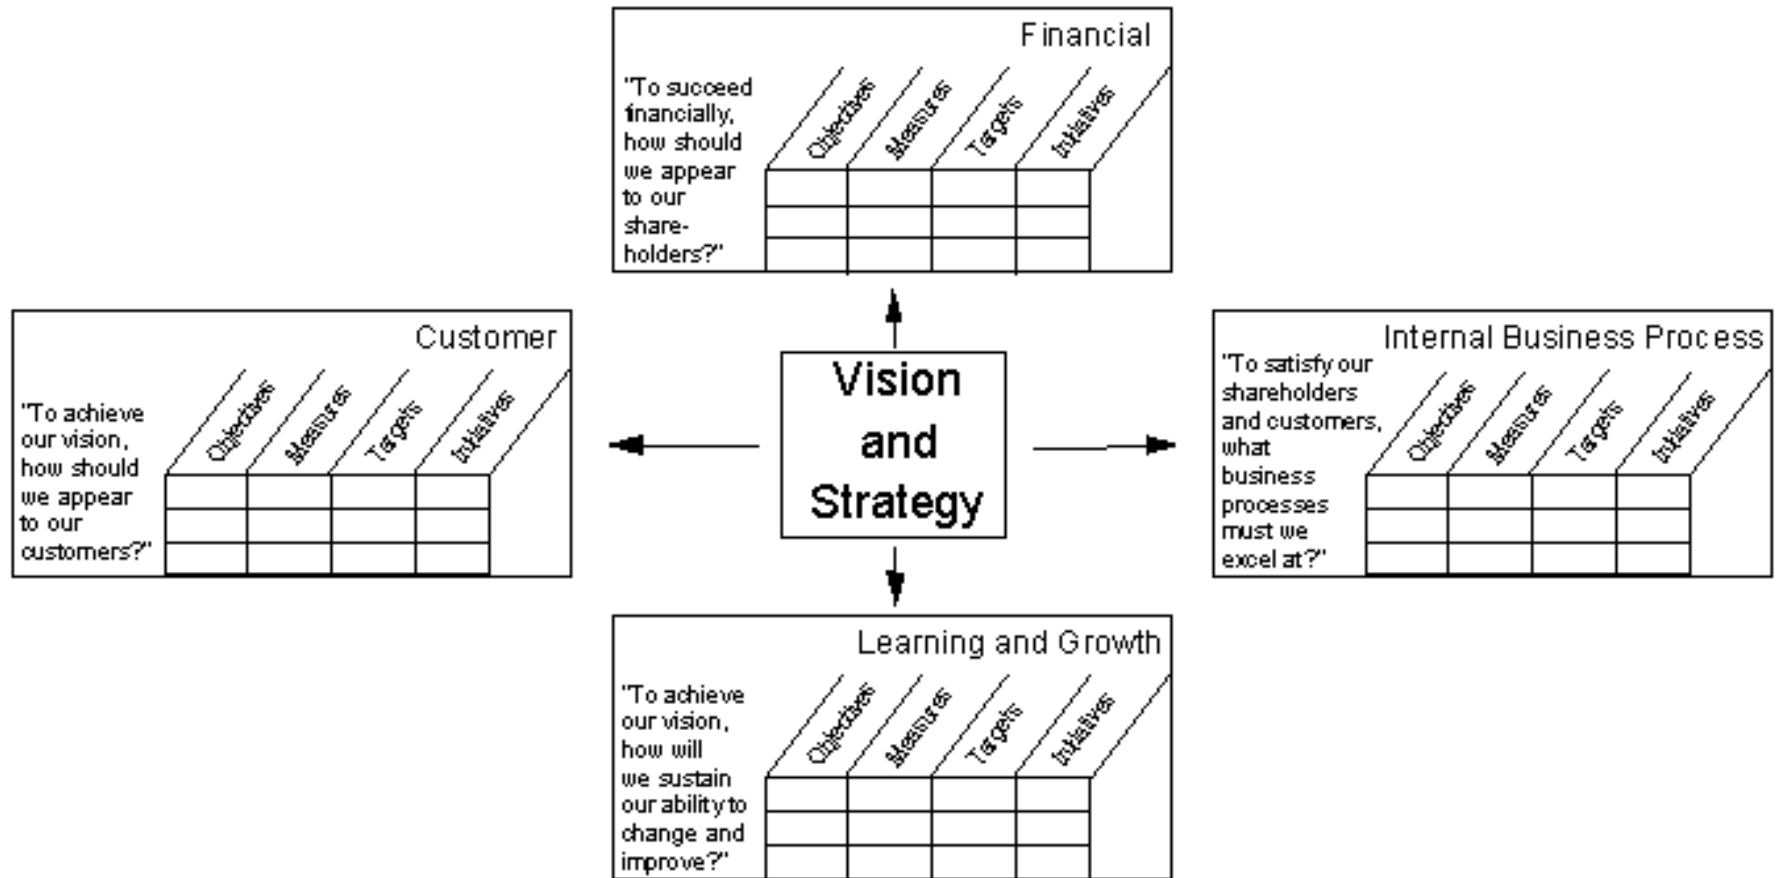

**Authors:** Kaplan & Norton (HBS) in the early ‘90s, originating from a French method called *Tableau du Bord* (turn of 20th century)

**Main measurement object:** whole organisation / a SBU

**Application:** BSc is one of the most relevant management practices of last 75 years, according Harvard Business Review Journal

# BSc framework

# BSc in the ICT field

Two interesting tailored versions of the BSc for the ICT field were developed in the last few years:

- Balanced IT Scorecard (**BITS**) by the European Software Institute (**ESI**)
- **AIS BSc** by the Advanced Information Services Inc. (**AIS**)

**Commonalities:** both frameworks support 5 perspectives, adding the "People/Employee" one

# ESI BITS

The perspectives, derived from the original framework and properly redesigned, are:

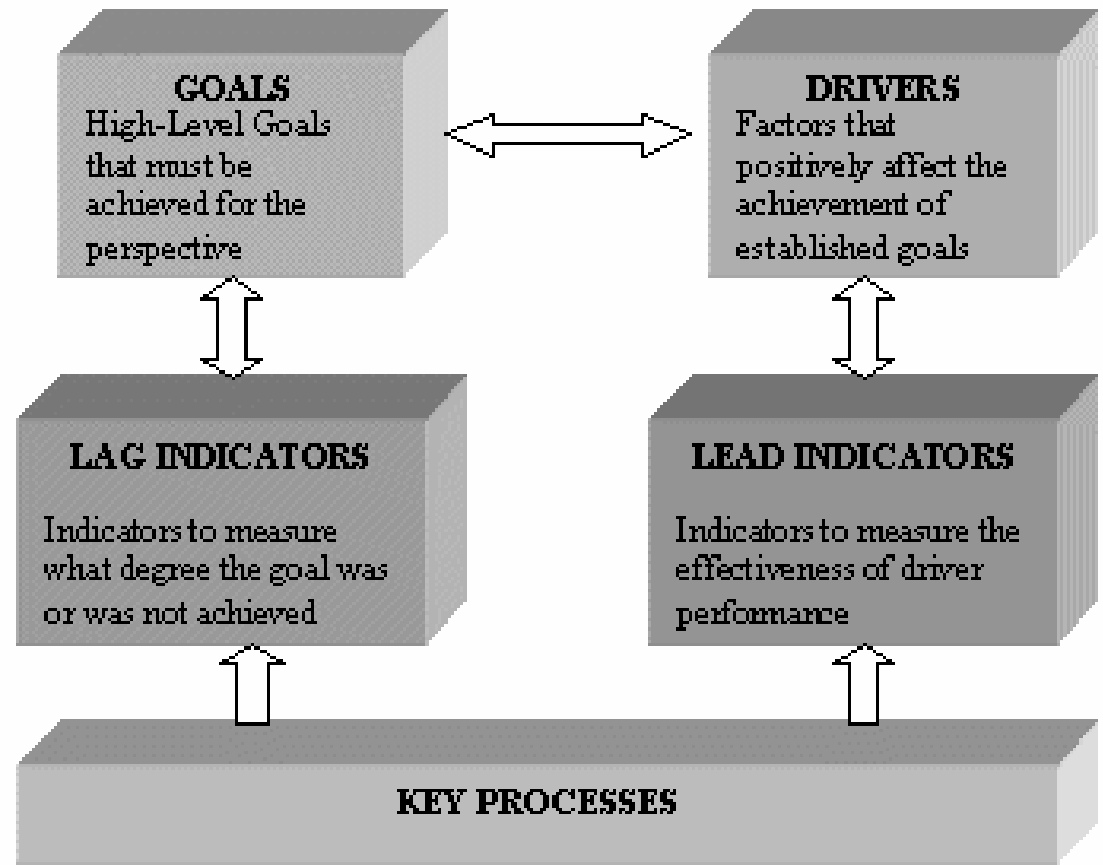

- **Financial:** *how do our software processes and SPI add value to the company?*
- **Customer:** *how do we know that our customer (int/ext) are delighted?*
- **People:** *is the people issues (competence, satisfaction and retention) properly managed to implement a sustainable improvement program?*
- **Process:** *are our software development processes performing at levels sufficient enough to meet customer expectations?*
- **Infrastructure & Innovation:** *are the technology and organisational infrastructure issues being addressed to implement a sustainable improvement program?*

## ESI BITS

The framework includes a set of goals, drivers, lead and lag indicators properly designed to cover a wide range of situations and organisation realities in the ICT field.

The figure shows the internal structure for each BITS perspective.

# ICT BSC: operational challenge

**Main BSC elements:** the so-called GDI elements. Actually GD are considered *structural elements* and a lot of attention has been paid to them, while few attention has been reserved to the *I* element, considered simply a *content element*.

**Use of Measures in General Business Performance Analysis:** measures need to be normalised based on the number of functional outputs of a production process (or of a business unit: i.e. how many hours by car, what is the asset cost by unit of production,...).

**Why normalise?:** it allows to use numbers for comparison purposes, that is they are necessary to produce reference numbers.

# ICT BSC: operational challenge

**How can reference numbers can be derived in evaluating software processes?** By figuring out how to measure the number of production units in software; since such a type of measure already exist in software, that is the Functional Size Measure (FSM), they are the type of measure to be used in ICT BSC since they measure the appropriate concepts and have the appropriate properties.

Solution Proposed: to use Functional Size Measures (FSM) such as Function Points (FPs) and the others techniques examined in the upcoming ISO/IEC 14143-x standard as the base for ICT BSCs.

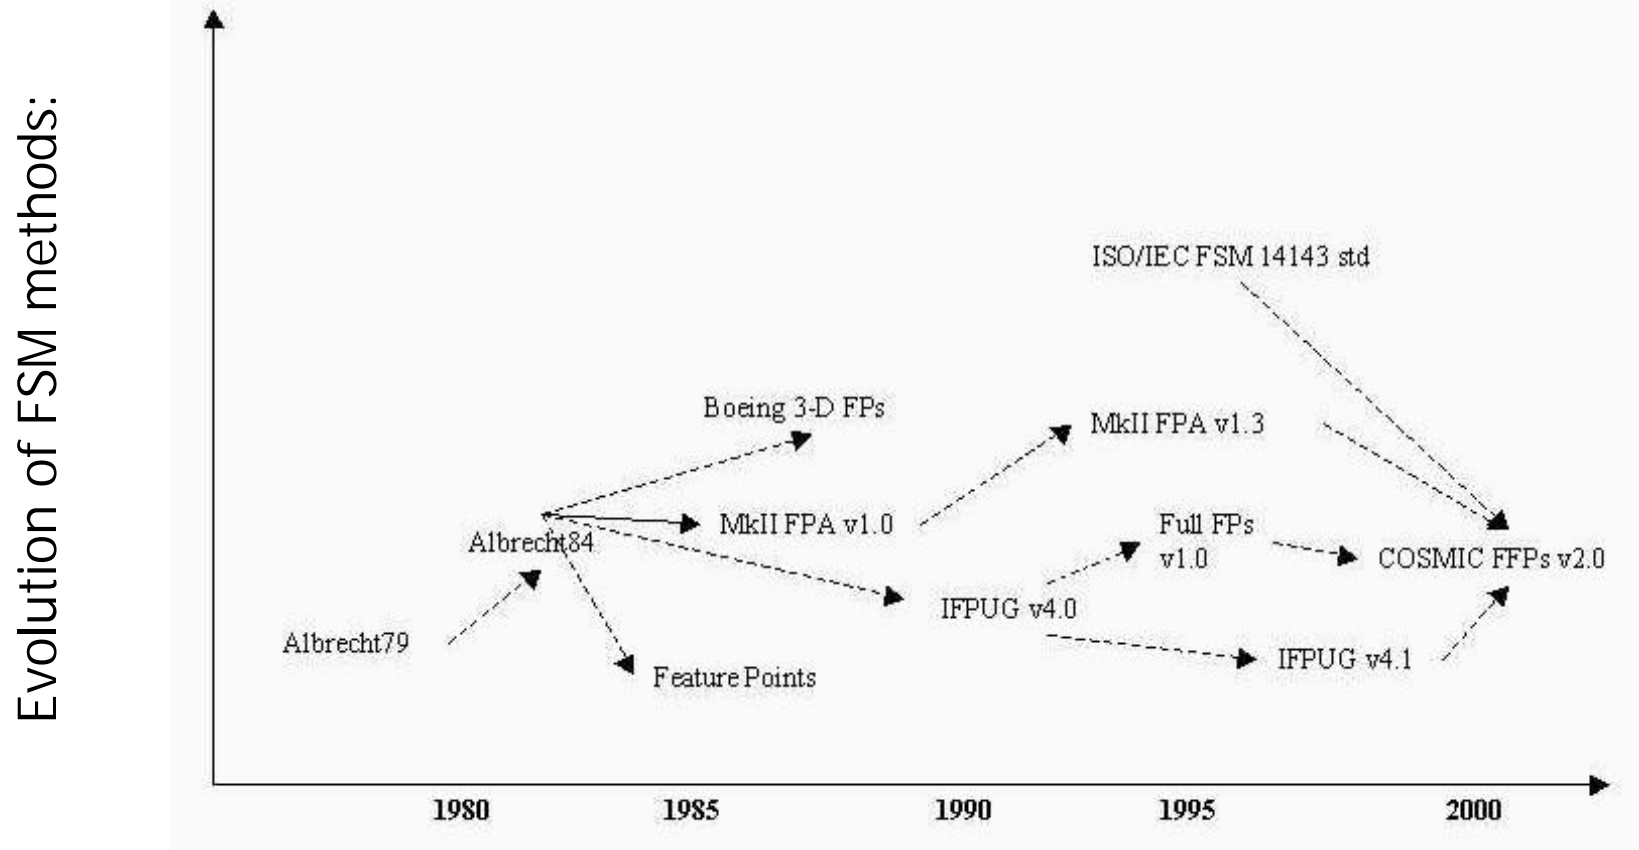

# Agenda

- Introduction
- Balanced Scorecard (BSC) framework
- Functional Size Measurement (FSM)
  - Evolution of FSM
  - FSM and Technical Size Measurement (TSM)
- Joining FSM and BSC
- Concluding Remarks

# Functional Size Measurement

ISO/IEC 14143: is the 5-part upcoming standard for FSM

# Agenda

- Introduction
- Balanced Scorecard (BSC) framework
- Functional Size Measurement (FSM)
  - Evolution of FSM
  - FSM and Technical Size Measurement (TSM)
- Joining FSM and BSC
- Concluding Remarks

## FSM and Technical Size Measurement (TSM)

**The Software Measurement arena includes two kinds of supporters:**

- *Functional Size Measurement (FSM)* methods, such as FPA
- *Technical Size Measurement (TSM)* methods, such as LOCs, # of programs, modules, reports, screens, widgets...

**Basic Difference:** the perspective FSM and TSM face off in measuring software.

- FSM attains to the “logical size” of a software (the *what*)
- TSM attains to the “technical size” of the software (the *how*)

## FSM and Technical Size Measurement (TSM)

### Question:

a contract for a software service can focus on software size from a

- logical viewpoint (FSM) -> *the producer will release the minimum amount of software technical items at the expected quality level*
- technical viewpoint (TSM) -> *the producer will release an unjustified increase of those measures, the functionalities required being equal. This will generate un-maintainable, incomprehensible, inefficient systems and the paradox that the customer could pay more for suppliers who are less efficient than others (for example, implementing the same functionality using more code).*

Which viewpoint is preferable?

## FSM and Technical Size Measurement (TSM)

### And in the ICT BSC?:

A BSC strategy should usually use more FSM than TSM!

### But...

TSM could be useful in the case of a strongly reuse-oriented environment.

Two possible viewpoints:

- **Functional Reuse:** *reuse of user of user recognisable and existing logical data structures and functionalities to build up new logical features*
- **Technical Reuse:** *reuse of existing physical data structures and software items (modules, objects, programs etc.) in order to build up new technical items to be used in the construction of new logical features*

## FSM and Technical Size Measurement (TSM)

### So...

Functional and Technical Reuse can be combined in several ways.

Best Savings: measuring both reuse type levels in the project in order to build the proper reuse strategy

ICT BSC perspectives "touched" by reuse:

- Process (Pr) -> *with reference to the "Application Dev. And Maintenance" Goal, "Reuse" Driver*

# Agenda

- Introduction
- Balanced Scorecard (BSC) framework
- Functional Size Measurement (FSM)
  - Evolution of FSM
  - FSM and Technical Size Measurement (TSM)
- Joining FSM and BSC
- Concluding Remarks

# How FSM can strengthen ICT BSCs

**4 main points can be stressed in supporting the title of this slide:**

- ❶ a measurement plan is more than a plan of measure
- ❷ measurement plans: strengths and weaknesses
- ❸ how to use FSM-based measures into organisations
- ❹ FSM-based measures fit into the ICT BSC measurement framework

In particular, points No. 3 and 4 must be detailed...

### ③ How use FSM-based measures into organisations

- **Extension of FPA usage:** from the '80s FPA has been used more and more not only for sizing software, but also for other usages, from Benchmarking to BPR
- **IFPUG Studies:** in previous works IFPUG started to split a series of FP-based ratios by intended Audience and Usage areas
- **Mapping GQM vs IFPUG 1992 document on measurement:**

Element	Correspondent Section Title
G – Goal	Development / Maintenance
Q - Question	Scenario
M - Measure	Measures

- **weaknesses:** IFPUG missed the “strategy” issue (*a BSC is more than GQM!*). In such a case, they would not have been a properly “value chain” from the Project up to the Corporate level

## ④ FSM-based measures fit into the ICT BSC

CONVERGENCE POINTS	COMMENTS
Alignment with business objectives	<i>prioritisation of effort and resources</i>
Balanced Set of Measures	<i>provides a global and complete perspective</i>
Integration of Measurement into development and support processes	<i>(improved project and process control</i>

# FSM-based measures and ICT BSC perspectives

# Agenda

- Introduction
- Balanced Scorecard (BSC) framework
- Functional Size Measurement (FSM)
  - Evolution of FSM
  - FSM and Technical Size Measurement (TSM)
- Joining FSM and BSC
- Concluding Remarks

# Concluding Remarks

- Functional measures are among the most important types in SwEng
- PM frameworks has paid strong attention only to the *GD* elements and not to the *I* one from the BSC GDI triad
- FSM-based measures (ISO/IEC 14143 std) can properly fit the multidimensional nature of an ICT BSC, providing ratios for all the ICT BSC perspectives, but pay carefull attention to the Reuse aspects also from the Technical Size Measurement (TSM) area
- Most impacted perspectives: Process (Pr) and Financial (F)
- Less impacted perspectives: Customer (C) and People (Pe)
- Linkages between perspectives:  $C \leftarrow Pr$  and  $Pe \leftarrow I \& I$
- Evolve the usage of FSM-based measures in ICT BSC for a more objective value in measuring software-related topics, if possible

# Question Time

Thank you for your attention!

# How Functional Size Measurement supports the Balanced Scorecard framework for ICT
